

**YOU KNOW IT'S A BABY!!  
HAVE YOU EVER SEEN  
AN ULTRASOUND?  
OF COURSE YOU HAVE.  
CASE CLOSED!**

*Here are milestones  
of pre-natal development  
for when most chemical  
abortions occur:*

- **5 weeks in the womb:** facial features are developing. Eye color is established.
- **6 weeks in the womb:** heart is beating, and the brain is divided into 3 parts.
- **7 weeks in the womb:** spontaneous movement begins. Yawning & sucking.
- **10 weeks in the womb:** finger prints and finger nails develop.
- **11 weeks in the womb:** all major organs are in place. Baby can smile.
- **13 weeks in the womb:** baby is active, but mom does not feel motion.
- **16 weeks in the womb:** baby can turn summersaults. Ovaries of girls forming.

**12 Weeks**

## **TRANSFER YOUR PRESCRIPTIONS: GOODBYE CVS AND WALGREENS!!!**

**WHY?** Because these chains have accepted the federal government's offer to fill prescriptions and profit from selling mifepristone that kills babies in the womb and harms moms.

Your first easy step is to visit the pharmacy you wish to use, such as Walmart, a grocery store pharmacy, etc.

Not Target! All Target pharmacies are CVS! :( Be prepared to provide prescription and insurance information. This pharmacy will process prescription transfers. Not difficult!

### **You can do this! You should do this!**

Later you should visit the Walgreens or CVS pharmacy and let a manager know WHY you moved your prescriptions.

Thank you for doing your part.  
We must be witnesses defending precious pre-born babies and their moms.

## **CHAIN PHARMACIES HAVE COMMITTED TO SELLING THE ABORTION PILL**

### **Snapshot of the pharmacy controversy**

- It is actually two pills: one brings death to the fetus. The second causes uterine contractions that expel the fetal remains.
- Over half of abortions in the USA are pill abortions. The percentage is rising.
- The pill abortion procedure sounds simple, but can be traumatic, taking several difficult days. There are significant health consequences including the possibility of maternal death. Risks are elevated for pill abortions with little medical oversight, as with abortion pills dispensed by pharmacies.
- Pill abortions are often confused with "the morning after pill" (also called Plan B). Morning after pills are taken within hours or a few days of sexual intercourse to block a viable pregnancy. The abortion pill brings death to a developing fetus during the 5th to 15th week of pregnancy or even later.
- Pill abortion has different names. Life defenders call it a chemical abortion or use its original name of RU486. The pro-choice side calls it medical abortion or DIY abortion (do it yourself abortion).
- In February of 2023, the corporate management of CVS and Walgreens accepted the Biden administration's offer to eventually fill prescriptions for chemical abortions.
- There is a silver lining. If a mom changes her mind after taking the first pill, the abortion process can be reversed! More about this later.
- We challenge the decision of CVS and Walgreens for breaking with the proud tradition of the pharmacy profession by agreeing to dispense pills intended for death rather than health.

# CHEMICAL OR PILL ABORTION WHAT IS IT?

For a 4-minute animated video of chemical abortion, use this QR code or this link: [abortionprocedures.com/abortion-pill](http://abortionprocedures.com/abortion-pill)  
The video is narrated by former abortionist Dr. Noreen Johnson.

A sequence of two pills kills and then expels a developing fetus from the uterus. The first pill, Mifepristone, blocks the body's production of progesterone, which breaks down the lining of the uterus. This terminates the flow of oxygen, blood, and nutrition to the fetus causing death.

Two days later, Misoprostol is taken. Misoprostol is commonly taken to induced uterine contractions to deliver healthy babies. For pill abortion the purpose is to expel the fetus killed by Mifepristone. With expulsion, the woman will often see the embryo intact, before flushing it down the toilet.

At times, the fetus lives through the pill procedure! This is called a "failure" and requires a surgical abortion. The failure rate increases with the length of the pregnancy. The initial FDA assessment found a failure rate rising from 2% to 7.3% for pill abortions at 10 weeks.

Along with the failure rates, risks to the health and life of the mother also rises with later-term pregnancy terminations.

The original FDA approval in 2000 allowed pill only up to 10 weeks. The original protocol also required an ultrasound exam, personal counseling, pills taken in the presence of a physician and a final doctor visit within two weeks. If the final visit indicated failure, the doctor performed a surgical abortion.

**Health of the woman protocols are mostly dismantled with pill abortions through pharmacy prescriptions.**

# JUST A FEW PILLS AND MANY DANGERS

Misoprostol, the second pill in the sequence, causes severe cramping, contractions, and heavy bleeding, which forces the dead baby out of the mother's uterus. Contractions and bleeding can last from several hours to several days and be very painful. Many women also experience nausea, vomiting, diarrhea, abdominal pain, and headache. Even after the baby is expelled, the bleeding and spotting may continue for several weeks.

Maternal deaths have occurred, most frequently due to infection and undiagnosed ectopic pregnancies. Dozens of American women have died following pill abortions.

**Alyona Dixon, a 24-year-old mother from Pahrump, Nevada, died days after obtaining a pill abortion at Planned Parenthood in mid-September of 2023. She was treated in a hospital emergency center prior to her death. According to the County Coroner, the cause of death was "complications from a septic abortion".**

Heightened dangers arise from pharmacy dispensed abortion pills. The pregnant woman receives no health exam, no ultrasound exam of her pregnancy, and no personal consultation with a physician.

- undetected ectopic pregnancy can cause fallopian tube rupture
- Rh-factor incompatibility causes immune response that can harm future babies
- Without identity verification, pills may be prescribed to a phony patient, possibly an abuser committing statutory rape.
- with no in-person screening, a sex trafficker can force an abortion upon a victim.

# THIS IS AMAZING AND LIFESAVING!! **ABORTION PILL REVERSAL**

An estimated 4,500 children who were on their way to chemical abortions are now playing and reading with their mom as a result of abortion pill reversal!!

**Here is what happens with this life saving "second chance" for baby and mom.**

The mother must change her mind soon after taking the Mifepristone but before taking Misoprostol which triggers labor. Mifepristone goes to work destroying the lining of the uterus by cutting off the supply of progesterone. The baby dies as his or her vital supply line from the mother is destroyed. The mom desiring reversal must quickly get in touch with a physician for a prescription that will counter the harm created by Mifepristone.

877-558-0333

[abortionpillreversal.com](http://abortionpillreversal.com)

The reversal process is not rocket science. The protocol was created by Dr. George Delgado. Like most obstetricians, Dr. Delgado was familiar with prescribing progesterone for pregnant moms when their natural production of progesterone was low. This condition is a significant risk factor for miscarriage. He reasoned what worked to counter low progesterone resulting from natural body function would also work when this resulted from a woman ingesting mifepristone in a pill abortion. When a mom changed her mind in favor of life for her baby, she could be given doses of progesterone to offset the killing effect of Mifepristone. This could sustain the vital needs of the baby and continue the pregnancy for a healthy delivery. Attempts to achieve abortion pill reversal are successful in about two-third of cases.
